CONTAINMENT PRODUCTS PROTECTING THE ENVIRONMENT

Environmental safety is at the core of 3GFS's containment product offerings. Fuel spills pose significant risks to ecosystems and can result in costly penalties, making effective containment essential. Halock's containment solutions are engineered to prevent, detect, and contain fuel leaks, thereby safeguarding the environment and ensuring regulatory compliance. One of Halock's flagship containment products is their double-wall piping system. These pipes feature a secondary layer that provides additional protection against leaks, with built-in sensors for leak detection. In the event of a breach, the secondary layer acts as a backup, preventing fuel from escaping into the environment. This dual-layer design enhances safety and makes leak detection easier, enabling quick response and minimizing environmental damage. Complementing the piping systems are Halock's spill containment sumps for filling, dispensers and tanks. These products are designed to provide effective containment of fuel spills, overflows, or accidental leaks.
